555 Timer Basics

TO-5 Package

Eight-pin IC, LM555CN
555 Internal Construction

- +Vcc (8)
- Discharge (7)
- Threshold (6)
- Control Voltage (5)
- Voltage Divider
- 5KΩ
- Voltage Comparators
- S
- Q
- R
- Flip Flop
- Inverting Buffer
- Discharge Transistor
- Reset Transistor
- GND (1)
- Trigger (2)
- Output (3)
- Reset (4)

8 Pin DIP (Dual Inline Package)
Explanation of Terminals for pin 555

- **Pin 1: Grounded Terminal:** All the voltages are measured with respect to this terminal.
Pin 2: Trigger Terminal:
This pin is an inverting input to a comparator that is responsible for transition of flip-flop from set to reset. The output of the timer depends on the amplitude of the external trigger pulse applied to this pin.
Pin 3: Output Terminal:
Output of the timer is available at this pin. There are two ways in which a load can be connected to the output terminal either between pin 3 and ground pin (pin 1) or between pin 3 and supply pin (pin 8).
Pin 3 continued...

- The load connected between pin 3 and the supply supply pin is called the *normally on load* and the load connected between pin 3 and ground pin is called the *normally off load*
Pin 4: Reset Terminal: To disable or reset the timer a negative pulse is applied to this pin due to the fact it is referred to as reset terminal. When this pin is not to be used for reset purpose, it should be connected to $+ V_{CC}$ to avoid any possibility of false triggering.
Pin 5: Control Voltage Terminal: The function of this terminal is to control the threshold and trigger levels. Thus either the external voltage or a pot connected to this pin determines the pulse width of the output waveform.
Pin 5 continued...

- The external voltage applied to this pin can also be used to modulate the output waveform. When this pin is not used, it should be connected to ground through a 0.01 micro Farad to avoid any noise problem.
Pin 6: Threshold Terminal:
This is the non-inverting input terminal of comparator 1, which compares the voltage applied to the terminal with a reference voltage of $2/3 \, V_{CC}$. The amplitude of voltage applied to this terminal is responsible for the set state of the flip-flop.
Pin 7: Discharge Terminal:
This pin is connected internally to the collector of transistor and mostly a capacitor is connected between this terminal and ground.
Pin 7 Continued...

- It is called discharge terminal because when transistor saturates, capacitor discharges through the transistor. The capacitor charges at a rate determined by the external resistor and capacitor, when the transistor is cut-off.
Pin 8: Supply Terminal:
A supply voltage of +5 V to +18 V is applied to this terminal with respect to ground (pin 1).

555 Internal Construction Fig 1

1. **GND**
2. **Trigger**
3. **Output**
4. **Reset**

- **Voltage Dividers**: 5KΩ
- **Comparators**: Voltage
- **SR Flip Flop**: Discharge Transistor
- **Inverting Buffer**: Reset Transistor
- **Control Voltage**: 5
- **Threshold**: 6
- **Discharge**: 7
- **Vcc**: 8

Additionally, there are various transistors and other components labeled in the diagram.
1456 Fig 2, Experiment 1

Diagram of a 555 timer circuit with connections to a 9V power source, a 100KΩ resistor, a 1KΩ resistor, and an LED.
